

Reflection Paragraph:

The lead-scoring logic performed accurately across all test runs, correctly classifying leads into High, Medium, and Low tiers based on budget-fit (₹50,00,000–₹3,00,00,000 inventory range) and lead source, and correctly excluding non-"New" leads (e.g., Jahid Hasan, marked "Contacted"). No leads were incorrectly prioritized in testing; however, the initial mock dataset happened not to include any lead with an in-range budget paired with a cold/ad source, so the Medium-priority branch went unverified until I deliberately added a test case (Mahmudul Hasan — ₹70,00,000 budget, Facebook Ad source), which the Skill then scored correctly as Medium. That gap points to a real limitation in my test design rather than the Skill's logic. Looking ahead, I'd improve the Skill in two ways: first, by adding data validation (a dropdown list) on the Source column in the Google Sheet, since the current fuzzy keyword-matching approach ("referral," "hot," etc.) could misclassify leads if agents enter inconsistent phrasing or typos; and second, by tightening Budget entry to a numeric-only column instead of a formatted string like "₹85,00,000," since any unexpected formatting (e.g., "85 lakh" or missing the currency symbol) would currently cause the Skill to treat the budget as "incomplete" and default the lead to Low priority, even if the underlying figure was valid.
